 - Expectimax

Outline

1 Non-deterministic Search

► Non-deterministic Search

► Adversarial Search

- We have seen search algorithms for environments that are **deterministic** and **fully-observable**
- When either, or both of these assumptions cannot be made, an agent needs to account for **percepts** in every move to narrow down the states where it is
- A solution can no longer be a flat **sequence** of actions, but rather a **contingency plan** (a.k.a. **strategy**)

- Recall the vacuum world, but with a non-deterministic suck action:
 - When applied to a dirty square, the action cleans the current square, but sometimes also **cleans an adjacent square**
 - When applied to a clean square the action sometimes dirties the square
- This requires
 - Different **transition model**
 - Different **solution** concept

Non-deterministic Transitions

1 Non-deterministic Search

- Result from a state now becomes Results:

$$\text{Results}(1, \text{suck}) = \{5, 7\}$$

Suck applied to state 1 results in the agent arriving either in states 5 or 7

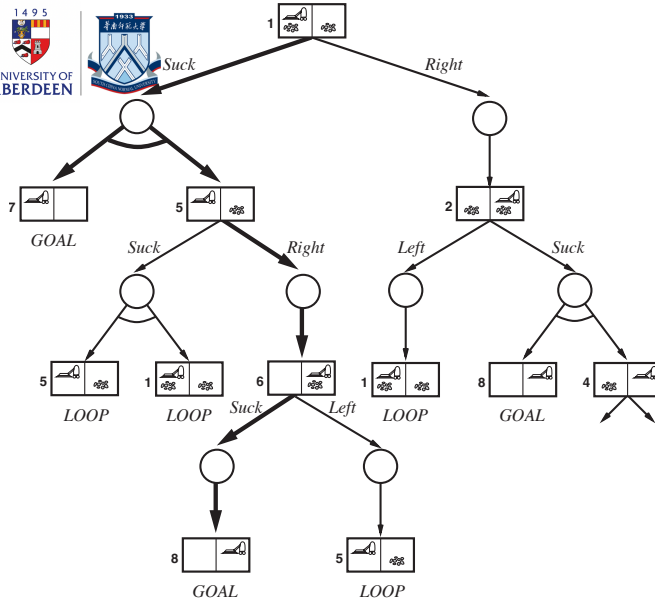

- Plan is now a contingency plan (a tree):

$[Suck, \text{if } State = 5 \text{ then } [Right, Suck] \text{ else } []]$

- In deterministic environments, branching only occurs due to agent's choice (OR Nodes)
- In non-deterministic environments, the environment's choice must also be taken into account (AND Nodes)
- Solution is a subtree of the AND-OR tree that:
 - Has a goal node at every leaf
 - Specifies an action at each OR node
 - Includes every outcome branch of its AND nodes

AND-OR Trees

1 Non-deterministic Search

First two levels of AND-OR
Search Tree for erratic
vacuum

- Or-Search: similar to regular search (agent has choice)
- And-Search: agent searching against the environment
- Notice failure condition on Or-Search

```
function And-Or-Graph-Search(problem)
    return Or-Search(problem.Initial-State, problem, [])
```

```
function Or-Search(state, problem, path)
    if problem.Goal-Test(state) then return []           ▷ the empty plan
    if state is on path then return failure
    for each action in problem.Actions(state) do
        plan ← And-Search(Results(state, action), problem, [state|path])
        if plan ≠ failure then return [action|plan]
    return failure

function And-Search(states, problem, path)
    for each si in states do
        plan ← Or-Search(si, problem, path)
        if plan = failure then return failure
    return[if s1 then plan1 else if s2 then plan2 else . . . if sn-1 then plann-1
    else plann]
```

Outline

2 Adversarial Search

► Non-deterministic Search

► Adversarial Search

Adversarial Optimal Decisions

2 Adversarial Search

- Each move we (MAX) makes has a response from MIN
- So the plan we look for is a contingent **strategy** with moves for:
 - The initial state; and
 - Every possible response from MIN
- We can calculate the value of the game recursively, assuming both players play optimally using the **Minimax** value

$$\text{Minimax}(s) = \begin{cases} \text{Utility}(s) & \text{if } \text{Terminal-Test}(s) \\ \max_{a \in \text{Actions}(s)} \text{Minimax}(\text{Result}(s, a)) & \text{if } \text{Player}(s) = \text{Max} \\ \min_{a \in \text{Actions}(s)} \text{Minimax}(\text{Result}(s, a)) & \text{if } \text{Player}(s) = \text{Min} \end{cases}$$

1: **function** Minimax-Decision(*state*) **returns** *an action*
 2: **return** $\arg \max_{a \in \text{Actions}(s)} \text{Min-Value}(\text{Result}(\text{state}, a))$

3: **function** Max-Value(*state*) **returns** *a utility value*
 4: **if** Terminal-Test(*state*) **then return** Utility(*state*)
 5: $v \leftarrow -\infty$
 6: **for each** *a* **in** Actions(*state*) **do**
 7: $v \leftarrow \text{Max}(v, \text{Min-Value}(\text{Result}(\text{state}, a)))$
 8: **return** *v*

9: **function** Min-Value(*state*) **returns** *a utility value*
 10: **if** Terminal-Test(*state*) **then return** Utility(*state*)
 11: $v \leftarrow \infty$
 12: **for each** *a* **in** Actions(*state*) **do**
 13: $v \leftarrow \text{Min}(v, \text{Max-Value}(\text{Result}(\text{state}, a)))$
 14: **return** *v*

14:  return v
```

- Time Complexity
 $O(b^m)$
- Space Complexity
 $O(bm)$
- Chess, on average:
 $b = 30 \ m = 40$

- Reducing complexity of b^m
 - Reduce branching factor (b)?
 - Reduce maximum search depth (m)?
 - Searching in a graph rather than a tree?

- Alpha-Beta Pruning
 - Evaluate which nodes/branches would not affect MIN/MAX's decision
 - Based on keeping track of two parameters:
 - α - value of the best (highest) choice we have in MAX's path
 - β - value of the best (lowest) choice we have in MIN's path
- Updates these values as one goes along the tree

(f)

Alpha-Beta Search: Move Ordering

2 Adversarial Search

- Pruning is strongly affected by the ordering of the moves in the tree
 - A good ordering*, would enable us to prune many nodes
- Move ordering is often game-dependent knowledge (heuristic)
- Dynamic move-ordering (killer-move heuristic)

- Dynamic heuristic to determine a “good” ordering
- Search two plies ahead until Max (alt. Min) causes a beta (alt. alpha) cutoff
- The move that caused the cutoff is the killer move

Reducing D - Killer Move

2 Adversarial Search

- Dynamic heuristic to determine a “good” ordering
- Search two plies ahead until Max (alt. Min) causes a beta (alt. alpha) cutoff
- The move that caused the cutoff is the killer move

Reducing D - Killer Move

2 Adversarial Search

- Dynamic heuristic to determine a “good” ordering
- Search two plies ahead until Max (alt. Min) causes a beta (alt. alpha) cutoff
- The move that caused the cutoff is the killer move

- Establish a cutoff depth and then estimate the value of future paths
 - Estimated value can be a heuristic (domain knowledge)
 - Values can be learned from previous games

$$\text{H-Minimax}(s, d) = \begin{cases} \text{Eval}(s) & \text{if } \text{Cutoff-Test}(s, d) \\ \max_{a \in \text{Actions}(s)} \text{H-Minimax}(\text{Result}(s, a), d + 1) & \text{if } \text{Player}(s) = \text{Max} \\ \min_{a \in \text{Actions}(s)} \text{H-Minimax}(\text{Result}(s, a), d + 1) & \text{if } \text{Player}(s) = \text{Min} \end{cases}$$

- **Weighted linear function over features** of a state

$$\text{Eval}(s) = w_1 f_1(s) + w_2 f_2(s) + \dots w_n f_n(s) = \sum_{i=1}^n w_i f_i(s)$$

- Example: Chess
Current state: pieces, and positions (structure)
- Example: Magic (Card Game)
Current state: Life Points, Cards in Play and Hand

- Evaluation function can also be learned (i.e. machine learning)
 - At cutoff we have a weighted linear function

$$\text{Eval}(s) = \sum_{i=1}^n w_i f_i(s)$$

- Record the features and actual value V at each evaluation

$$w_1, w_2, \dots, w_n, V$$

- Use supervised learning on weights w_i to approximate actual outcome

- As in non-adversarial search, many states will be revisited
- However, only recording visited states is not enough (since MIN can deviate in the future)
- Need to store actual loop paths (memory intensive)
 - Requires “caching” strategy

- Many tabletop games, and most simulated games include an element of chance
 - e.g., Backgammon
- Outcome of agent choices is not deterministic
 - Games must take into account multiple outcomes for the player
- Solution: weight outcomes by their probability
 - Expected value

$$\text{ExpectMinimax}(s, d) = \begin{cases} \text{Utility}(s) & \text{if } \text{Terminal-Test}(s, d) \\ \max_{a \in \text{Actions}(s)} \text{ExpectMinimax}(\text{Result}(s, a)) & \text{if } \text{Player}(s) = \text{Max} \\ \min_{a \in \text{Actions}(s)} \text{ExpectMinimax}(\text{Result}(s, a)) & \text{if } \text{Player}(s) = \text{Min} \\ \sum_r \mathbb{P}[r] \text{ExpectMinimax}(\text{Result}(s, a)) & \text{if } \text{Player}(s) = \text{Chance} \end{cases}$$

- Since the outcomes of all actions are stochastic, instead of computing all expected utilities, we can sample game outcomes
 - Simulate games but choose **one random outcome** per player choice
 - Monte Carlo Rollout

- We've seen how to model games:
 - Building a game-tree
 - Finding the optimal moves in fully observable settings
- There are many other types of games
 - Multiplayer games
 - Stochastic Games
 - Partially-observable games

Any Questions.
